

NEW TURNING/MILLING CENTER NOW OPERATIONAL!

Lampin Corporation is excited to announce the purchase of a new Ganesh Cyclone 32-CS 7 axis Turn/Mill center! This highly versatile piece of equipment is capable of turning components up to 36MM (1.417 in), and with 27 tools installed; it can produce many custom parts complete without the need for secondary operations to be performed on other machines.

Most custom parts that Lampin manufactures for our customers need both turning and milling operations to produce the part. This usually meant moving partially completed components from our lathes to our milling centers. Moving parts through multiple machines increased cycle time and delivery time to our customers. With this new Ganesh Cyclone we can often produce a complete part on one machine reducing our turnaround time. Furthermore, the new Cyclone frees up milling capacity in our machining centers to produce larger, higher complexity milled components with longer cycle times. The increased maximum diameter of 36mm on the Cyclone 32- CS also means many parts can now be turned from bar stock rather than having to be chucked which also reduces cycle time for our customers.
